

The Art Applewhite 18" saucer kit, What you get for your money, along with a lot of packing peanuts!

One of these rockets is not like the others ;-). They wanted to put it on the further back cell, but the lack of rail buttons prevented that

Just after deployment of the “mustache”. I’m not really sure how that effected the flight, but what ever works. Kudos to Mike Knouse for his excellent photography work on this picture

Another great shot from Mike Knouse of the saucer tumbling to earth after deployment

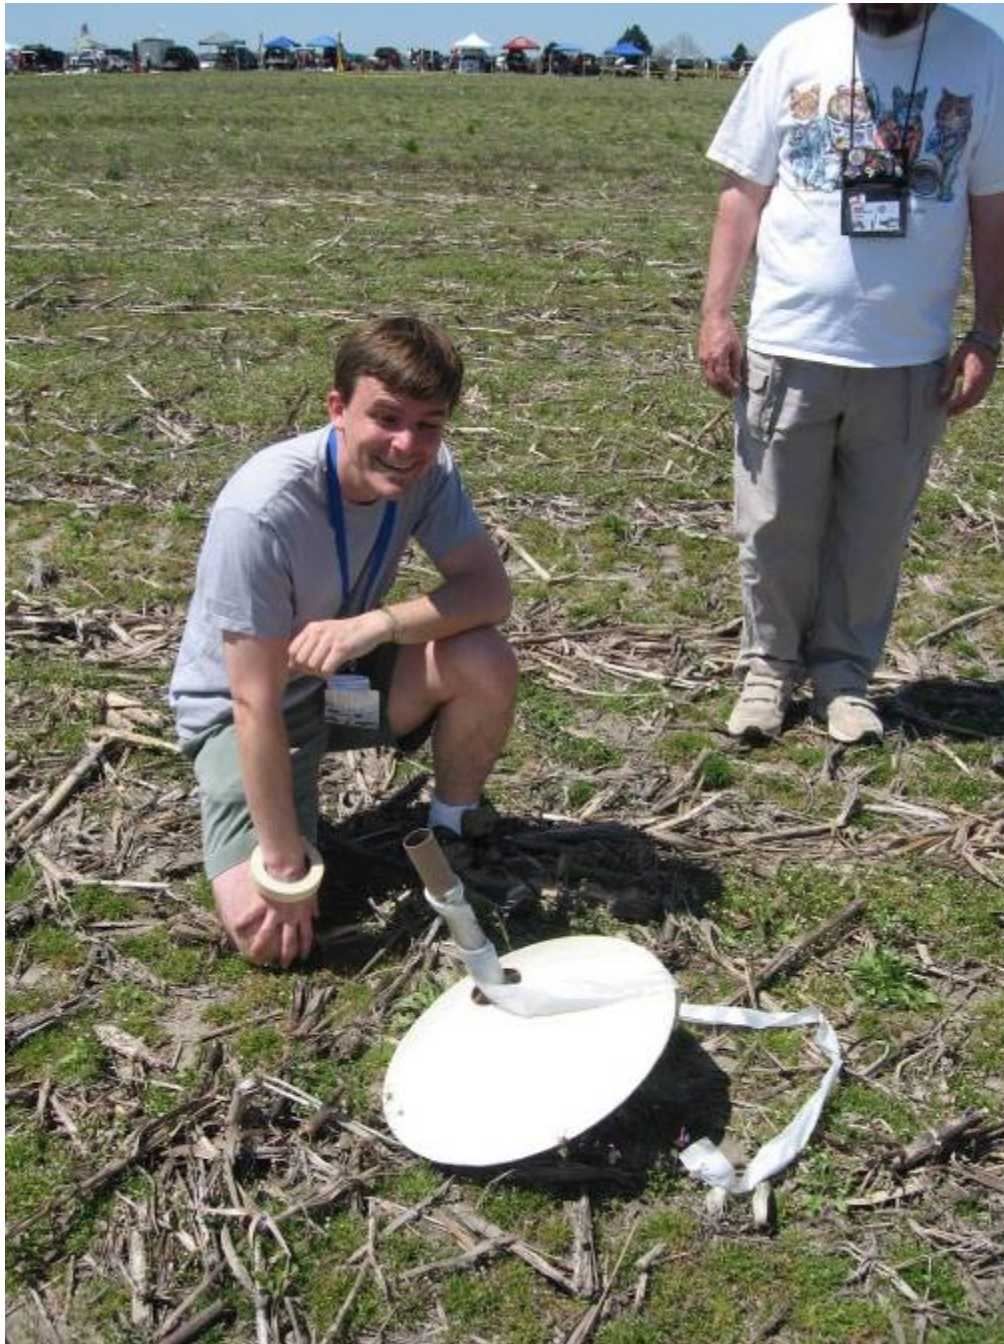

My Fluid Dynamics professor would probably love this shot showing the vortices produced by the saucer falling back to earth. If it weren't for the "active recovery device" this would have been a much prettier shot. Thanks again Mike for the pic!

I'm pretty sure this is how the mustache is supposed to work. Even so, this is a beautiful shot of an unusual rocket tumbling back to earth. Thanks mike for the image!

On the ground at Higgs dairy farm, this is exactly how it landed. Probably only about 200 feet from the pad and sitting perfectly upright on the ground.

I'm smiling so much
I'm about to swallow
my ears. Thanks Will
and Mitch for your
help!

The obligatory shot
of the hat pin, so
new it's still in it's
wrapper!
